New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway -

157pp; English

The invention relates to a high growth methanotrophic bacterial strain, comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprise a pyrophosphate dependent phosphofrutokinase enzyme or a 16s compression and for the biotransformation of a nitrogen-containing compound, compound, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a compression of a protein, carbohydrates and a compression of a feed product comprising a protein, carbohydrates and a compression of a containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste the present. The bacterial strain of the invention can be used as a containing compound of a protein source. It is also used in the containing environment carbohydrates and a wide contained to grant the protein of bromass including proteins carbohydrates and a wide contained to grant the granticularly for isoprenoid pigments for the contained compounds, useful as pigments and as monomers in polyments carbohydrates and as monomers in polyments contained and contained and contained to the proteins of the invention of terpenoid and contained and in production of exopolysacharides at high levels.

AA 片 밁 δ RESULT encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carb substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas 16a sp. D-1-deoxyxyluiose-5-phosphate synthase (Dxs) Carotenoid; isopentenyl pyrophosphate; antheraxanthin; danti-oxidant; steroid; flavour; fragrance; electro-optic application; aquaculture; enzyme; D-1-deoxyxylulose-5-phosphate synthase; Dxs. AAE22301 standard; Protein; 620 07-MAR-2002 Methylomonas 16a Methylomonas 16a sp. D-1-deoxyxylulose-5-phosphate 25-JUL-2002 The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the producing carotenoid compounds e.g. antheraxanthin and astaxanthin, using microorganisms having a mucleic acid molecule encoding enzyme the carotenoid biosynthetic pathway and which metabolize single car 01-SEP-2000; 01-SEP-2000; 04-SEP-2001; 2001WO-US27420 Sequence Claim 41; substrates (BUPO) 541 2002-351711/38. used DU PONT DE NEMOURS & LSLVGLDSKGILATIEQFCA 620 Page 109-111; 156pp; English. Novel nucleic isolated from acid molecule encoding a isoprenoid biosynthetic enzyme, Methylomonas 16a, useful for the production of isoprenoid

Claim 4; Page 66-68; 84pp; English

an isoprenoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for producing recombinant organisms for producing various isoprenoid compounds. The mucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 1 (ORF1) dxs (1-deoxyxylulose-5-phosphate synthas enzyme) protein of the invention, as described above. The present invention relates to a new nucleic acid molecule encoding synthase

                                                                                                                                                               CC The sequence represents Pseudomonas aeruginosa deoxyxylulose-5-phosphate CC synthase, dxs. (Ant)agonists of dxs are useful for treating an individual CC in need of enhanced or inhibited activity or expression of or CC immunological response to dxs. Dxs and the nucleic acid encoding it are CC useful as diagnostic reagents, especially in relation to diseases related CC useful as probes or primers and to synthesise full length dxs CC polynucleotides. The nucleic acid and protein are useful for diagnosing CC bacterial infections, especially by Pseudomonas aeruginosa, staging a CC disease or response of an infectious organism to drugs, and are also used in a structure based design of an (ant)agonist to dxs. The nucleic acid, CC protein and antibodies raised against it are useful for screening for CC (ant)agonists of dxs or the nucleic acid and are useful to interfere with the initial physical interaction between a pathogen and amamalian host CC responsible for sequelae of infection. These molecules are useful in CC preventing adhesion of gram positive and/or gram negative bacteria to CC wounds; to block bacterial adhesion; to block the normal progression of pathogenesis in infections initiated other than by the implantation of CC in-dwelling devices or by other surgical techniques. Dxs is also useful for irreating Helicobacter pylori infection, and also to CC carcinoma.

```
isoprenoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isoprenoid compounds. The polypeptides are useful for the production of isoprenoids, especially CoO(10). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DXS) activity or decapyrenyl diphosphate synthase (DXS) activity, is useful for increasing production of CoO(10) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isoprenoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      310
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          255
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              75
                                                                                                                                                                                                            550
The sequence represents Pseudomonas aeruginosa deoxyxylulose-5-phosphate synthase, dxs, temperature sensitive mutant, ts-80. (Ant)agonists of dxs creating the distribution of the distribution of the distribution of enhanced or inhibited activity or expression of or immunological response to dxs. Dxs and the cucleic acid encoding it are useful as diagnostic reagents, especially in relation to diseases related to expression or activity of dxs. Pxagments of the nucleic acid are useful as probes or primers and to synthesise for diagnosing bacterial infections, especially by Pseudomonas carryinosa, staging a disease or response of an infectious organism to dxs. The nucleic acid are useful for sevential to used in a structure based design of an (ant)agonist to dxs. The nucleic acid, protein and antibodies raised against it are useful for screening for (ant)agonists of dxs or the nucleic acid and are useful for acreening for lant)agonists of dxs or the nucleic acid and are pathogen and a mammalian host responsible for sequelae of infection.

CC These molecules are useful in preventing adhesion of gram positive and/or gram negative bacteria to eukaryotic extracellular matrix proteins or in-dwelling devices or in wounds; to block bacterial adhesion; to block the implantation of in-dwelling devices or by other surgical contection, and also useful for identifying membrane bound or soluble receptors. The (ant)agonists are useful for treating Helicobacter pylori infection, and also to prevent, inhibit or treating Helicobacter pylori confection, and also to prevent, inhibit or treating the locater or deprived from the dra sequence is not shown in the specification but is derived from the dra sequence given in AMMOGOL2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New deoxyxylulose-5-phosphate (dxs) polypeptides of Pseudomonas aeruginosa useful for diagnosis of dxs expression or activity related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19-AUG-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Deoxyxylulose-5-phosphate synthase; dxs; agonist; antagonist; diagnostic; eukaryctic extracellular matrix protein; antibody; wound; in-dwelling device; Helicobacter pylori infection; gastric ulcer; gastritis; gastrointestinal carcinoma; mutant; mutein; ts-32.

```
CC of the nucleic acid are useful as probes or primers and to synthesise C full length das polynucleotides. The nucleic acid and protein are useful CC for diagnosing bacterial infections, especially by Pseudomonas CC aeruginosa, stagling a disease or response of an infectious organism to CC drugs, and are also used in a structure based design of an (ant) agonist to das. The nucleic acid, protein and antibodies raised against it are CC useful for screening for (ant) agonists of dax or the nucleic acid and are useful to interfere with the initial physical interaction between a CC pathogen and a mammalian host responsible for sequelae of infection. CC These molecules are useful in preventing adhesion of gram positive and/or CC gram negative bacteria to eukaryotic extracellular matrix proteins or in-dwelling devices or in wounds; to block bacterial adhesion; to block the normal progression of pathogenesis in infections initiated other than CC the implantation of in-dwelling devices or by other surgical CC infection, and also useful for identifying membrane bound or soluble receptors. The (ant) agonists are useful for treating Helicobacter pylori infection, and also to prevent, inhibit or treat gastric ulcers, CC gastritis and gastrointestinal carcinoma.

CC from the dxs sequence is not shown in the specification but is derived CC from the dxs sequence given in AAU00012.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     문
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibictics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The prevention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to scenen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-MAY-2000;

The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC derived recombinant DNAs or transformed products in a culture system and CC extracting the isoprenoid accumulated in the medium. The DNA encodes at CC least 1 of the following; (a) a compound for activating or catalysing CC the production of 1-deoxy-D-xylulose-5-phosphate from pyruvic acid and CC glycerylaldehyde-3-phosphate; (b) an enzyme producing farnesyl pyrolinic CC acid; (c) a protein which leavates the efficiency of synthesis of CC isoprenoid compounds and comprises a 3 or 4 amino acid sequence CC optionally with 1 or more of the amino acid being deleted or CC substituted or an additional amino acid being inserted; (d) a protein which activates or catalyses the production of 2-C-methyl-D-erythreitol-CC 4-phosphate from 1-deoxy-D-xylulose-5-phosphate; or (e) a protein which activates a target compound or reaction and is a string end or hybrid of CC the DNA encoded in (a)-(e). Isoprenoid compounds are useful in drugs CC (e.g. for the treatment of heart diseases, osteoporosis and hemostatis, CC (e.g. cothings. The isoprenoid salso inhibit enzymatic reactions on the non-mevalonate pathway and can be used as antibacterials and CC herbicides. The present sequence is used in the exemplification of CC the DNA encoded in (a)-(a).

AXX AAYOB
AC This invention describes a 1-deoxy-D-xylulose-5-phosphate synthase (DXS) protein or active fragment and a DXS modulator. The DXS modulator is a structural analogue of pyruvate, glyceraldehyde-3-phosphate (GAB) or 1-deoxy-D-xylulose-5-phosphate (DXP). Compounds that inhibit DXS activity are potentially useful as pesticides, antibacterial agents or herbicides. Compounds that stimulate DXS activity are potentially useful as growth promoters or for increasing biosynthesis of DXP derivatives, especially isoprenoids such as carotenoids, chiorophyll, phytols, lutein, sterols, ubquinone, rubber and taxanes.

The method can be used to produce transgenic plants which have higher levels of isoprenoids, an which have health care benefits when consumed. The present sequence represents the DXPS protein from Bscherichia coli, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for manipulating isoprenoid expression in cells or organisms having a mevalonate independent isopentyl diphosphate (IPP) synthesising pathway. The method compriss altering the activity of 1-deoxy-D-xylulose-5-phosphate synthase (DX or a functional equivalent, derivative, or bioprecursor of it. The

01-OCT-1998;
                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes the novel use of a DNA sequence encoding 1-deoxy-D-xylulose-5-phosphate synthase (DoXS), and optionally p-hydroxyphenylbyruvate dioxygenase (HPPD) and/or geranylgeranyl-tocopherol, vitamin K, chlorophyll and/or carotenoid content. Transgenic plants containing DOXS DNA coding sequences can be used for production of plant and bacterial DOXS which also have increased tocopherol, vitamin K, chlorophyll and/or carotenoid content. The test system can be used to identify inhibitors of DOXS. This sequence represents the Escherichia coli DOXS protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DOXS; 1-deoxy-D-xylulose-5-phosphate synthase; HPPD; GGPPOR; plant; p-hydroxyphenylpyruvate dioxygenase; tocopherol; vitamin K; chlorophyll; geranylgeranyl-pyrophosphate oxidoreductase; carotenoid; transgenic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain annibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic conformat directly from MIPO at CC format directly from MIPO at the format directly f

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to methods and materials for the production of isopremoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isopremoid compounds. The polypeptides are useful for the production of isopremoids, especially Cog([0]). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DXS) activity or decaprenyl diphosphate synthase (DXS) activity, is useful for increasing production of Cog([0]) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isopremoid production of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Substantially pure polypeptides having e.g., 1-deoxyxylulose-5-phosphate synthase activity, production of isoprenoids, especially CoQ(10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAO21860 standard; Protein; 620

                                                                                         The invention relates to methods and materials for the production of isoprenoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isoprenoid compounds. The polypeptides are useful for the production of isoprenoids, especially CoQ(10). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DMS) activity, is useful for increasing production of CoQ(10) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isoprenoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Substantially pure polypeptides having e.g., 1-deoxyxylulose-5-phosphate synthase activity, production of isoprenoids, especially CoQ(10)
                                                                    production of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
